

WATER HERO SYSTEMS

NEXT GENERATION LEAK DETECTION

By Dan Sterling, CEO & Founder of Water Hero

On October 9th, 2017 at 10PM, a pipe burst in the ceiling of a doctor's home in a small town on Staten Island while he was about to go away for the weekend. We know this is typical - 1 in 55 homes have a severe water leak each year in the United States, and this one had the potential to cause over \$100,000 worth of damage.

But in this case – there was something different. This local doctor had the next generation Internet Connected leak detection and automatic water shut-off installed in his plumbing system – the Water Hero P-100.

Water Hero quickly detected a leak, sending the doctor a text message when his user configured thresholds were exceeded and automatically shut off the water in the doctor's home. ***The result was a 20 gallon leak instead of a 2,000 gallon leak. Family Heirlooms were saved and significant home damage was prevented!***

Water Hero was designed to prevent damaging leaks like the one illustrated above but also helps building owners, property managers and homeowners to ***detect and prevent non-damaging leaks that drive up those monthly water bills.***

Time and time again, we hear people complain about the surprise water bill that runs \$1,000 or more. Additionally, over 10% of homes have a leak of 90 gallons or more each day – which costs over \$600 per year. Water Hero ***highlights eroded toilet flappers, hoses left on, leaks in underground sprinkler pipes and irregular water use*** so that you can easily prevent those surprisingly high water bills and ensure that you are not flushing money down the drain. Many of our clients detect leaks immediately after installing Water Hero, leading to an ROI in months.

Here's how we do it...

Water Hero is internet-connected and uses sensors to digitize flow information from a traditional water meter. When the water flow exceeds user set thresholds, Water Hero sends the user a text and/or e-mail and automatically shuts off their water. Water Hero also has a temperature sensor that can send you a text and/or email alert when you're at risk of freezing and a back-up battery so that it functions when your building is most vulnerable – when the power goes out.

Best of all, everything is controlled over the web or through your smartphone so you can easily change your settings, open and close your valve and more.

Water Hero works! Ask the folks below who decided Water Hero is the best fit for them and are happy that they did!

The product very easy to set up and has performed perfectly from the first. Overall, very pleased with the product.

"We recently suffered water damage causing water to flow in the house for a few hours while we were away. The consequence was approximately \$35k in damage...not to mention the inconvenience of having to move out of the house while the professional water mitigation crew were working..."

I started to look online to see what might be available...the Water Hero P-100 was EXACTLY what I was looking for...

Given we are residents of CA, where we have had severe drought, the water usage meter is a bonus, as it allows us to see exactly how much water is being used, and by which devices/appliances

As a small bonus, our insurance co offers a discount on our premium for having a 'whole house' leak detector. In fact, given how frequently water damage occurs (much more frequent than fires), and the cost to the insurance industry, it's surprising that they don't offer an upfront cash incentive to homeowners to install such devices.

Overall, very pleased with the product "

- Frank L., Los Gatos, CA

Identify underground leaks that were not otherwise detectable. One had been active for 8 years.

"We are amazed with the results of our Water Hero. Even today, we located underground leaks. I purchased the Water Hero System because there had been multiple water events when my building was unoccupied. These events resulted in water bills over \$1,000 dollars for each breakdown. Since installing the Water Hero System, I see the water consumption in real time. This led me to identify underground leaks that were not otherwise detectable. One leak had been active for 8 years! I am pleased with the capabilities the system has and look forward to monitoring water usage from the away position. I liked that the system was complete and easy to install."

– Dirk K., Aruba

The benefits of Water Hero are clear – advanced whole building leak detection protecting your home from damaging leaks and saving money from high water bills. Don't scatter moisture sensors all throughout your home or building to still fall short of full protection from a burst pipe. Protect with Water Hero - your whole building leak detection system accessible remotely over the web, with alerts right to your phone and water usage data down to the minute.

Water Hero offers it all, reliably and affordably. Please reach out with any questions about our systems. We'd love to speak with you!
